# The future of Commercial Door Management is here... Now!

## SDS/IFMN FEATURES

The Intelligent Facility Management Network (IFMN) is the solution for your Portal Management, Security Access & Perimeter Door Management concerns. This web based system is designed to collect, analyze, and report critical Door/Gate/Access Control operation information. This includes data feeds from entry and exit access controls, video cameras, security monitors, and the control systems for electromechanical devices with their safety and operational control systems. This system integrates these functions into a single portal management device and reports event data in easily understood language to a web based information management system. The event is comprised of reader data, door/gate/barrier operational status, required diagnostic, action, fault conditions, etc., with the addition of video evidence.

## SDS/IFMN SOFTWARE

The patented SDS/IFMN provides additional capabilities not found in any other system. Incorporated into the IP Door/Equipment Controller are state of the art communications that support remote reporting, operation and security monitoring of multiple facilities from a single location including personal 3G capable devices. The IFMN utilizes a secure host computer facility with redundant storage and power supply. Back up, Firewall and data protection utilities provide security for all customers. The ability to capture, summarize and report critical event and operational data provides management with unparalleled information about actual door usage, security malfunctions and maintenance issues.
